Project 1 Commentary

The computational complexity of of every method is 0(n) with the exception of quit which is O(1). For insertEnd, insert, delete, edit, print, and search involve you iterating through the entire list or through a variable amount. I don't believe a linked list is a terrible way to implement a text editor however this format was not the best. As far as a device to learn linked lists, this worked perfectly. As a text editor this implementation is not very easily used and will likely get unwieldy with larger documents. From this assignment I learned the value of programming more modually. I should've built a single function and tested it thoroughly before creating the others. I had initially made a rough version of every function only to find that nothing worked as intended.
